CHAPTER I

1 INTRODUCTION AND OBJECTIVES OF THE SURVEY

1.1 *INTRODUCTION*

Agriculture is a dominant sector of Ethiopian economy which makes a lion share contribution to Gross Domestic Product (GDP), employment and foreign exchange earnings of the country. Agriculture is still believed to remain a determinant sector that can play a dominant role in stimulating the overall economic development of the country in the years to come. This would be realized if and only if strenuous efforts are made by the government and other concerned stakeholders including farmers to increase agricultural productivity. Among the factors that contribute to the increment of agricultural productivity, some are increased use of modern farm inputs such as improved seed, fertilizers and through modernizing farming activities by using improved farm implements and farming system as well as through introducing modern farming technologies to the sector. In order identify, plan, implement and monitor agricultural projects and programs, among other things, availability of reliable, comprehensive and timely statistical data on the overall performance of the sector is essential. For that matter, Central Statistical Agency (CSA) of Ethiopia has been conducting four integrated annual agricultural sample surveys and has been providing the survey results to the ultimate data users for more than three decades.

Out of the annual agricultural sample surveys carried out by the CSA, Belg season agricultural sample survey is the one that generates data on crop cultivated area, production and farm management practice for the major Belg season crops of the private peasant holdings on annual basis. In the previous years, two reports were used to be generated from the Belg agricultural sample survey nearly simultaneously which are named as a report on area and production and report on farm management practices. As of the year 2013/14 (2006 E.C.), the Belg season agricultural sample survey findings are compiled and produced in only one report with the basic idea of making the report user friendly and handy in this report . The report is contained with the data on crop cultivated area and production as well as farm management practices of the private peasant farming of the major Belg crops for the year 2013/14 (2006 E.C). The findings are summarized and presented using tables and graphs at national and regional levels.

1.2 *OBJECTIVES OF THE SURVEY*

Availability of adequate and timely agricultural data is important for policy formulation, designing of different projects and programs and to conduct various researches on agriculture. Given the importance of agricultural data, the two main objectives of the 2013/14 (2006 E.C.) Belg season agricultural sample survey is to generate basic quantitative information on:

- Crop cultivated area, production and yield of major Belg season crops and
- The use of different farm management practices that includes the type and quantity of fertilizers used, crop cultivated area with fertilizer, areas under irrigation, areas applied with improved seeds and indigenous seeds, areas applied with pesticide,... etc.

Given the two objectives of the survey, while presenting and discussing the survey findings, first summary of area and production is discussed and followed by the summary of the farm management practices findings, subsequently.

CHAPTER II

2 SURVEY METHODOLOGY, DATA COLLECTION AND PROCESSING

2.1 COVERAGE

The 2013/14 (2006 E.C) Annual Agricultural Sample Survey of the Belg season covered the entire rural parts of the country except the non-sedentary population of the three zones of Afar and six zones of Somali regions. Accordingly, all parts of Harari, Dire Dawa as well as 60 Zones (Special Weredas that are treated as Zones of other regions) are also considered in the survey. The survey was planned to cover a total of nearly 1 492 Enumeration Areas (EAs). However, in 226 EAs among the selected EAs, the survey was not successful due to various reasons. Therefore, the survey was successfully accomplished involving only 1 266 EAs.

2.2 SAMPLING FRAME

The list of Enumeration Areas (EAs) was obtained from the 2007 Population and Housing Census. From the list of the EAs obtained, a set of sampled EAs were selected based on the sample design proposed for the survey. Once the selection of the sampled EAs was accomplished, a fresh list of households within each selected EA was carried out. The list of agricultural households in each EA was used as a sampling frame from which the agricultural households are finally selected as sources of data for data collection.

2.3 SAMPLE DESIGN

In order to select the survey sample, a stratified two-stage cluster sample design was implemented. Enumeration areas are the primary sampling units (PSUs) whereas the agricultural households are the Secondary Sampling Units (SSUs). The sample size for the 2013/14 agricultural sample survey was determined by considering both the required level of precision for the most important estimates within each domain and the amount of resources allocated to the survey. In order to reduce the non-sampling errors, considerable effort was allocated to manage the survey in terms of quality and operational control. With the exception of Harari, and Dire Dawa, each region was taken to be the domain of estimation. Each

zone of the regions / special woredas was adopted as a stratum for which major findings of the survey are reported.

2.4 SELECTION SCHEME

Enumeration areas from each stratum were selected systematically using a probability proportional to size sampling technique; size being the number of agricultural households. From the fresh list of households prepared at the beginning of the survey, 30 agricultural households within each sampled EA are selected systematically. The estimation procedures of totals, ratios, sampling error and the measurements of precision of estimates (CV) of the survey are given in Appendix-I, II and III.

2.5 FIELD ORGANIZATION

The Central Statistical Agency (CSA) has 25 statistical branch offices located in different parts of the country. Each branch office has its respective branch head, field supervisors, enumerators, other supporting staffs and drivers. By the year 2013/14 (2006 E.C.), 24 Branch offices are involved in the field operation activities of agricultural sample survey of the Belg season. In order to accomplish the data collection activities, field enumerators are equipped with the necessary survey equipments such as GPS, compass, programmable calculator, measuring tape, questionnaire ... etc. To facilitate the field work of data collection and for field supervision, the branch offices used the available four-wheel drive vehicles. The Addis Ababa statistical branch office did not take part on the 2013/14 (2006 E.C) Belg season agricultural sample survey as the farming activities by smallholder private holdings are not commonly practiced in the EAs of the branch office.

2.6 TRAINING OF THE FIELD STAFF

At the beginning of the survey year, the field staff-training program was carried out for the survey in two-stages. The first stage training was the training of the trainers which was carried out at Mekelle, the capital of Tigray National Regional State for six consecutive days. In the first stage training, the trainers were the staff from the head office while the trainees were branch statistical office heads, statisticians and some field supervisors. The manpower trained in the first stage inturn provided similar training for the enumerators and field supervisors for 20 days in the 24 Statistical Branch Offices at the second stage training. During the

second-stage training, the trainee were given detailed classroom training on the objectives and uses of the Agricultural Sample Survey (AgSS), concepts and definitions of terms used, the method of area measurement, interviewing procedures, ... etc. The second stage training also included a field practice to reinforce the procedures discussed in the classroom, to identify the boundaries of the households included in the EAs and to practice interviewing, area measurement using GPS and compass rope techniques, etc.

2.7 METHODS OF DATA COLLECTION

The agricultural data for 2013/14 Belg season crops were collected from the selected rural agricultural households by interviewing the respondents (subjectively) supported by questionnaire and by measuring physically (objectively) the farm fields (areas) for the selected agricultural households using the equipments such as GPS, compass and measuring tape.

A major characteristic of Ethiopian agriculture is the existence of two well-known crop production seasons named as Meher (main) and Belg (short rain) seasons. Meher is a long rainy season which normally occurs from June to September. The Belg season most often refers to small rainy season which normally occurs from February to May mostly in limited areas of the country. Generally, the Meher season rain provides ideal crop growing moisture for the longer maturing crops.

A point of contention arises with respect to the pure definition of Belg crops. Belg cropping practices are heterogeneous across different parts of the country. The nature of the sowing period also overlaps with some of the Meher season crops. Consequently, the report on Belg Season crops in the past faced a problem of a clearly defined growing period. To help clarify the two-crop season, the following definitions have been used since 1987/88: Belg Season Crops are defined as crops that are harvested during the months of March to August, while crops that are harvested during September to February are considered as Meher season crops.

The time period for data collection on area, production and agricultural practices of the Belg season was from ‘Miyazia 15/2006 to Ginbot 30/2006 E.C. (May 23 to June 7, 2014). Belg season’s crop cultivated area data are collected objectively using compass/GPS and measuring tapes, while production data were collected subjective by interviewing the agricultural holders face to face. Data on production of Belg season crops are calculated from the condition factor data that are collected directly from the sampled holders within the households and development agents (DA). The enumerators are trained to systematically present the

questions to the respondents on percentage change bases using the local translation and meaning. The enumerators were also trained on how to use comparative associations to represent the concept of percentage changes and to fill in the questionnaire.

2.8 DATA PROCESSING

a. Editing, Coding and Verification

To insure the quality of the collected data, data editing, coding and verification tasks were conducted. For data editing, coding and verification purpose, instruction manual was prepared and four data editors were involved in the editing, coding and verification of the data in the head office. The number of editors participated in editing was relatively lesser relative to the last year due to the shortage of manpower during the time of editing. Although some of the branch offices accomplished the editing work in their respective offices, most of the editing work was accomplished in the head office. Generally, editing, coding and verification of all questionnaire were completed in 16 days. The edited data finally went through computer data entry operation.

b. Data Entry, Cleaning and Tabulation

Before starting data entry, computer edit specifications were prepared for use on personal computers and CSPro Software was used for the purpose of data consistency checking. The filled in questionnaire data were entered into personal computers by data encoders of CSA through the use of CSPro. About 73 data encoders and 6 supervisors were involved in this total process and it lasted 26 days to complete the data entry activity. After the data entry was accomplished, the data were checked for consistency and cleaned using the data cleaning specifications prepared for this purpose. Finally, tabulation was done on personal computers to produce results as indicated in the tabulation plan.

2.9 BASIC CONCEPTS AND DEFINITIONS

For a better understanding of the data presented in this report, the basic concepts and definitions of some technical terms and terminologies used in the collection of the agricultural sample survey data for 2013/14 (2006 E.C.) Belg season are indicated as follows.

Enumeration Area (EA): An Enumeration Area in the rural parts of the country is a locality that is in most cases less than and in some cases equal to a farmers' association in geographical area and usually it consists of 150 to 200 households.

Household: A household may be either:

- a) A one person household, that is a person who makes provision for his own food or other essentials for living without combining with any other person to form part of a multi-person household or
- b) A multi-person household, that is, a group of two or more persons who live together and make common provisions for food or other essentials for living. The persons in the group may pool their incomes and have a common budget. They may be related or unrelated persons, or a combination of both. These persons are taken as members of the household.

Agricultural Household: A household is considered as an agricultural household when at least one member of the household is engaged in growing crops and/or breeding and raising livestock in private or in partnership with others.

Holding: A holding is all the land and /or livestock kept, which is used wholly or partly for agricultural production and is operated as one technical unit by one person alone, or with others, regardless of the title, legal form, size or location.

Holder: A holder is a person who exercises management and control over the operations of the agricultural holding and that makes the major decision regarding the utilization of the available resources. The holder has primary technical and economic responsibility for the holding. The holder may operate the holding directly as an owner or as a manager. Under conditions of traditional agricultural holding, a person may be regarded as a holder when the person operates land or raises livestock in his own right, with or without getting helps from others. In other words, a holder is a person who decides on what, when, where and how to grow crops or raise livestock and the one who has the right to determine the utilization of the products.

Parcel: A parcel of a holding is any piece of land entirely surrounded by land, water, road, forest... etc., which are not part of the holding. A parcel may consist of one or more cadastral units, plots or field adjacent to each other.

Field: A field is defined as any plot of land which is a parcel or part of a parcel under the same or mixed crops or any other form of private holding.

Belg Season Crops: are defined as any temporary crops that are harvested during the months of March (Megabit) to August (Nehase).

Meher Season Crops: are those crops that are harvested during September (Meskerem) to February (Yekatit).

Irrigated area: refers to the area of land that is purposefully and actually provided with water artificially, other than by rain for improving the production of crops. The uncontrolled flooding of land by the over flow of rivers or streams is not categorized as irrigation practice although sometimes farmers use this incidence for crop production.

Improved Seed: is defined as crop variety which gives significantly higher yield, better quality and/or better benefit compared to traditional varieties of seeds and usually produced by the Ethiopian Seed Enterprise (ESE) in Ethiopia.

Fertilizer: refers to anything applied to the soil that is intended to increase the amount of plant nutrients available for crop growth. Fertilizers are usually categorized into two which include natural and chemical fertilizers. Examples of natural fertilizers are farmyard manure and wood ashes while that of the chemical fertilizers are DAP (Di-Ammonium Phosphate) and UREA (Ammonium Nitrate).

Pesticides: Pesticides are chemicals useful for the mitigation, control or elimination of pests which are harmful to crop. Insecticides, herbicides and fungicides are all considered as pesticides.

CHAPTER III

3 SUMMARY OF MAJOR FINDINGS OF THE SURVEY

3.1 AREA AND PRODUCTION

The general overview of the total cropland¹ area cultivated and total production of the country for Belg season of 2013/14 (2006 E.C) shows an increment compared to the performance of 2012/13 (2005 E.C) Belg season. The total cropland area cultivated increased by 8.15% (from 1 396 472.47 hectare in 2012/13 (2005 E.C) to 1 510 345.14 hectare in 2013/14). Similarly, total crop production is also increased by 16.52% (which is an increment from 21 881 719.6 quintals in 2012/13 (2005 E.C) to 25 495 860.11 quintals in 2013/14 (2006 E.C)). Increased utilization of improved farm management practices are among the factors that can positively contributed to increased production during the 2013/14 (2006 E.C) Belg season. It is also important to note that three crops named masho, white and red haricotbeans (which was formerly named haricotbeans) and yam are included in the crops surveyed in 2013/14 (2006 E.C Belg season) unlike the previous years which could bring change in the total cropland area cultivated and production on Belg season. Given this background, the main findings of the 2013/14 (2006 E.C.) Belg season crop production sample survey are presented in this Chapter.

3.1.1 Grain Crops: refer to a major crop category that includes cereals, pulses and oilseeds, which are not only the major food crops of country and but also are the main sources of household income and sources of the foreign currency earnings. The 2013/14 (2006 E.C) Belg season agricultural sample survey result indicates that a total land area of about 1 327 860.49 hectare was cultivated by the major Belg crops (grains) from which a total grain production of about 10 970 571.62 quintals was estimated to be harvested at national level. As compared to the production year of 2012/13 (2005 E.C) grain cultivated area and production has increased by 7.8% and 11.89%, respectively. Out of the total estimate of Belg season cropland area and production, cereals accounted for the largest percentage in both crop cultivated area and in production. Cereals accounted for about 1 037 966.49 hectares (78.17% of the national Belg grain cropland area) and about 9 576 746.66 quintals (87.29% of the total national grain production). Following cereals is, pulse crops which accounted for about 261 101.05 hectares (19.66% of the total grain area) and about 1 388 083.6 quintals

¹ Total cropland area and production refers total grain crops, vegetables and root crops total area and production for Belg season

production (which is 12.65% of the total grain production). Moreover, oilseeds are the other category of grain crops produced which accounted for an area of 28 792.96 hectares (2.17% of the total grain area) and 5 741.36 quintals of production (0.05% of total grain produced during the Belg season). (For more details, see Summary Table 1).

Summary Table 1: Cropland Area and Production of Major Belg Crops: Private Peasant Holdings, 2013/14 (2006 E.C.), Country Level

Crop Category	Total Cropland Area		Total Production	
	in Hectare	%	In Quintals	%
<i>Cereal</i>	1 037 966.49	78.17	9 576 746.66	87.29
<i>Pulses</i>	261 101.05	19.66	1 388 083.60	12.65
<i>Oilseeds</i>	28 792.96	2.17	5 741.36	0.05
<i>Grain crops</i>	1 327 860.49	100	10 970 571.62	100

In order to illustrate the overall performance of the 2013/14 (2006 E.C) crop production year, the total estimated cropland area and production of grain crops for private peasant holders for seasons of Meher and Belg as well as for commercial farms are presented in the Summary Table 2. By the year 2013/14 (2006 E.C) the overall grain cultivated area estimated is about 14 337 647.65 hectare. As compared to 2012/13 (2005 E.C), there is a 1.8% increment in area cultivated of major grain crops nationally where the last year's area was 14 083 525.54 hectares (this value is obtained from the last years report, not given in Table 2).

Summary Table 2: Summary of National Grain Cropland Area and Production of Meher season, Belg Season and Commercial Farms during 2013/14 (2006 E.C.), Country Level

	Grain crops	%	Grain	%
	Area (Ha)		Production(Qt)	
Meher season private holdings	12 407 473.46	86.54	251 536 623.90	91.66
Belg season private holdings	1 327 860.49	9.26	10 970 571.62	4.00
Commercial Farms	602 313.70	4.20	11 919 952.76	4.34
Grand total	14 337 647.65	100	274 427 148.28	100

Out of the total grain area estimated, Meher season grain area accounted for about 12 407 473.46 hectare (86.54% of the total grain area cultivated) while Belg and commercial farms accounted for about 1 327

860.499 hectares (9.26% of total grain area) and 602 313.70 hectares (4.2% of the total grain area cultivated) respectively.

The total grain crops produced during 2013/14 (2006 E.C) amounts 274 427 148.28 quintals which is increased by 9% from the 2012/13(2005 E.C) total production that was 251 050 015.88 quintals, considering Meher, Belg and commercial farms. Meher season, Belg season and commercial farms account for about 251 536 623.90 Quintals (91.66%), 10 970 571.62 Quintals (4%) and 11 919 952.76 Quintals (4.34%) of the total grain production, respectively for the year 2013/14 (2006 E.C).

3.2 ESTIMATES OF THE 2013/14 (2006 E.C) TOTAL CROP LAND AREA AND PRODUCTION OF MAJOR CROPS, MEHER AND BELG SEASONS

For the year 2013/14 (2006 E.C.), the total cropland area cultivated of major crops (grains) of the private peasant holdings during both seasons was estimated to be 13 735 333.95 hectares (commercial not included). Meher season accounts for 12 407 473.46 (90.67%) while Belg season accounts for 1 327 860.50 (9.33%) of grain crops area cultivated during both seasons. The estimated area of grain crops cultivated during both seasons is given in Summary Table 3.

Summary Table 3. Cropland Area under Major Crops for Private Peasant Holdings 2013/14 (2006 E.C.), Both Seasons: Country Level

<i>Crop Type</i>	<i>Total Grain Cropland Area in Hectares during</i>					
	<i>Meher Season</i>		<i>Belg Season</i>		<i>Both seasons</i>	
	<i>Area in Ha</i>	<i>%</i>	<i>Area in Ha</i>	<i>%</i>	<i>Area in Ha</i>	<i>%</i>
<i>Cereal</i>	9 848 745.96	79.38	1 037 966.49	78.17	10 886 712.45	79.26
<i>Pulses</i>	1 742 602.19	14.04	261 101.05	19.66	2 003 703.24	14.59
<i>Oilseeds</i>	816 125.31	6.58	28 792.96	2.17	844 918.27	6.15
<i>Total</i>	12 407 473.46	100.00	1 327 860.50	100.00	13 735 333.96	100.00

As indicated in Summary Table 3, cereals accounted for about 10 886 712.45 hectares (79.26% of the total grain cultivated area) while Pulses and Oil crops accounted for about 2 003 703.24 hectare (14.59%) and 844 918.27 hectares (6.15%) of the total grain cropland area, respectively, in both seasons. Graphical representation of the estimates of total area under major crops for private holdings in Ethiopia for both seasons during 2013/14 (2006E.C) is indicated using Figure 1 as follows.

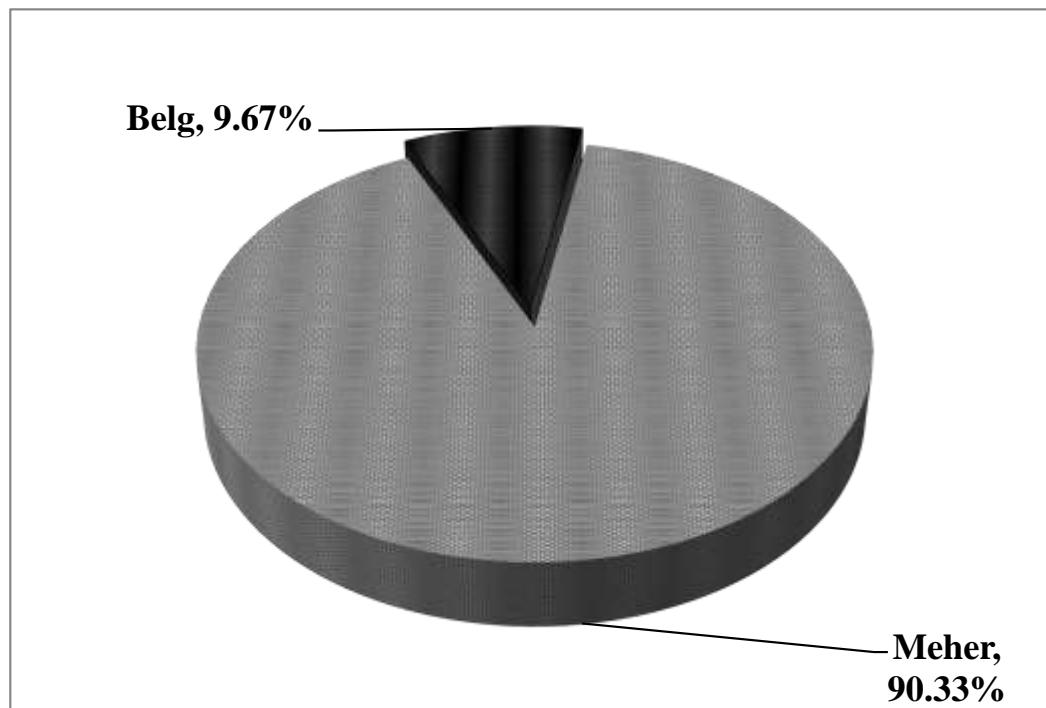

Figure 1 Estimates of Total Area under Major Crops for Private peasant Holdings in Ethiopia for Both Seasons 2013/14 (2006 E.C)

Figure 1 shows that out of the total major crops cultivated area by private peasant holdings during both seasons of 2013/14 (2006 E.C), Belg and Meher seasons account for 9.67% and 90.33%, respectively. Likewise, the overall performance of the major grain crops production estimates for both seasons is illustrated in Summary Table 4.

Summary Table 4. Total Production of Major Crops Harvested by Private Peasant Holdings, 2013/14 (2006 E.C.), Both Seasons: Country Level

Crop Type	Total Production in Quintals, Harvested during					
	Meher Season		Belg Season		Both seasons	
	Production in Quintals	%	Production in Quintals	%	Production in Quintals	%
<i>Cereal</i>	215 835 255.61	85.81	9 576 746.66	87.30	225 412 002.27	85.87
<i>Pulses</i>	28 588 805.90	11.37	1 388 083.6	12.65	29 976 889.50	11.42
<i>Oil crops</i>	7 112 592.38	2.82	5741.36	0.05	7 118 333.74	2.71
Total	251 536 623.90	100	109 705 71.62	100.00	262 507 195.52	100.00

The Summary Table 4 indicate that cereals production accounted for about 225 412 002.27 quintals (85.87% of the total grain crops) produced in both seasons. Pulses and Oil crops account for about 29 976 889.50 quintals (11.42%) and 7 118 333.74 (2.71%), respectively of the total sum of both seasons..

Moreover, the graphical representation of the estimates of the total production of major crops for private holdings in Ethiopia for both seasons during 2013/14 (2006 E.C) is indicated using Figure 2 bellow.

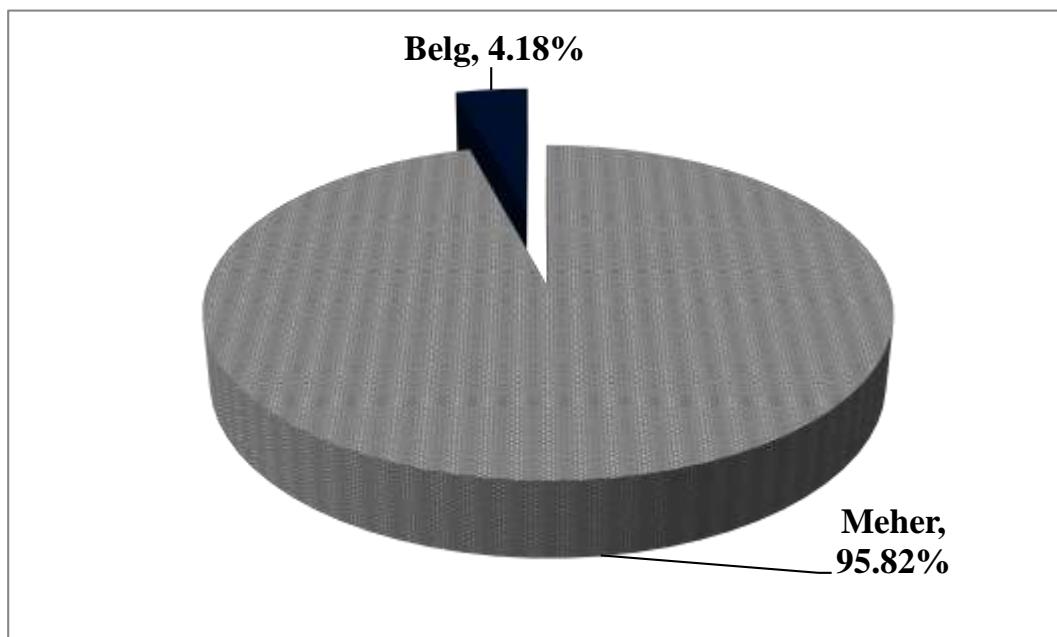

Figure 2 Estimates of Total Production of Major Crops for Private Holdings in Ethiopia for Both Seasons of 2013/14 (2006 E.C)

Figure 2 indicates that out of the total of major crops produced by private peasant holdings during both seasons of 2013/14 (2006 E.C), Belg accounts for 9.67% (which is about 10 970 571.62 quintals) whereas Meher accounts for 95.82% (about 251 536 623.90 quintals).

3.1.3 Vegetables: holders living near to urban centres largely practice vegetable farming. Vegetable farms are not commonly practiced by the rural private peasant holders which is evidenced by the small volume of production recorded as indicated by the survey result. This is better indicated in Figure 3. Vegetables account about 1.87% of the area under all crops at national level during the Belg season. Out of the total area under vegetables, 81.26% and 7.64% are accounted for Ethiopian Cabbage and Tomato, respectively (See Statistical Table 6).

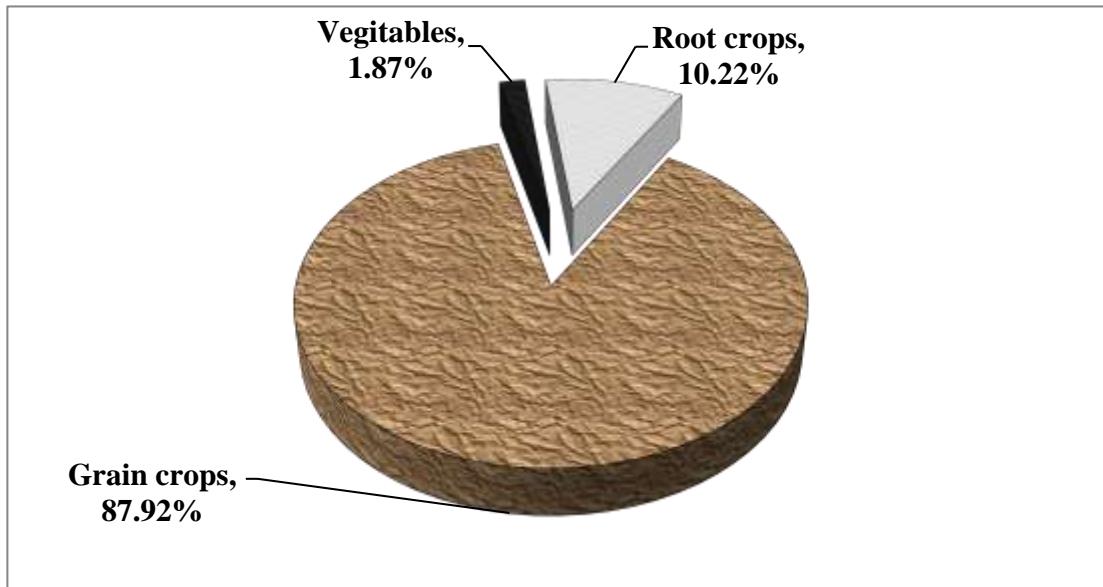

Figure 1: *Percentage of Area under Major Belg Season Crops in 2013/14(2006E.C), National*

3.1.4. Root Crops: - Root crops such as onion and garlic are indispensable to improve the taste and scent of the food we eat. Other crops like potatoes, sweet potatoes and taro/ Godere are among the major root crops that are consumed in the country. The economic importances of these crops prompt the peasant farm holders to grow many of the root crops as shown in the survey results. For more details, see the statistical Table 5. Root crops covered nearly 10.22% of the area under all Belg crops in the country. Potatoes, onion and sweet potatoes accounted for 72.74%, 10.40% and 9.56% of the total root crop area cultivated, respectively. In terms of production, potatoes, onion and sweet potatoes accounted for 65.16%, 7.87% and 19.51% of the total root crop production, respectively.

NOTES:

1. Some estimates in all reporting levels are excluded due to high coefficient of variations. Nevertheless, they are incorporated in the total estimates. Hence the sum of the specific estimates may not be equal to the total estimates.
2. Users are also advised to use those estimates with 30-50% coefficient of variation (CV) cautiously
3. Even though area is reported for some crops in some reporting levels, no production data is available such cases are designated by Not Stated (NS). On the other hand, in all tables “-” labeled for data not available totally.

CHAPTER IV

4 FARM MANAGEMENT PRACTISES OF THE 2013/14 (2006 E.C) BELG SEASON

4.1 INTRODUCTION

The observed experiences indicate that farmers' attitude and tendency towards adoption and acceptance of new innovations, modern agricultural techniques and technologies such as the use of fertilizers, irrigation and improved seeds have positive impact on the development of agricultural sector as a whole. In this regard, the extent of adoption of modern agricultural practices such as utilization of fertilizer, irrigation, pesticides and improved seeds by the private peasant farm holders is often used as important indicators for estimating the rate and extent of modern technologies used in the country's agriculture. The magnitude and level modern/improved farm management practices in the agricultural sector are used to be the sole indicators of the transformation rate of the country's traditional agriculture to modern agriculture.

The general overview of the 2013/14 (2006 E.C) Belg season farm management practice of the country indicates that cropland areas applied with chemical fertilizers increased by 16% (which was estimated to be about 312 869 hectare in 2012/13 (2005 E.C) has increased to about 363 607 hectares in 2013/14 (2006 E.C). Likewise, the total quantity of chemical fertilizers applied during the season has also increased by 47.32% (from 396 706 quintals in 2012/13 (2005 E.C) to 584 431 quintals in the 2013/14 (2006 E.C) Belg season, at national level. In addition, improved seed applied area also increased by about 90% (from 39 914 hectares in 2012/13 (2005 E.C) to about 76 213 hectares in 2013/14 (2006 E.C). In terms of quantity, the use of improved seed applied has increased by about 56% which is an increment from 15 232 quintal in 2012/13 to 23 744 quintals in 2013/14 (2006 E.C). It is also important to note that the inclusion of the three crops (masho, haricotbeans and yam) could increase the on the change in the total areas applied with various types of inputs and the total quantity of inputs used.

Given this background, in Chapter four, the quantitative information about the use of modern agricultural inputs for Belg season crops of 2013/14 (2006 E.C.) of the private peasant holdings are presented both at country and regional levels. Furthermore, the general composition of the farm holders surveyed applying

inputs in terms of age group, holders applying inputs by educational status and the number of holders and the damaged crop land area in hectare are summarized and presented in this Chapter. The data are generated from the findings of Belg season agricultural sample survey conducted by the Central Statistical Agency of Ethiopia in May 2014.

4.2 SUMMARY OF THE FARM MANAGEMENT PRACTICES OF THE 2013/14 (2006 E.C)

BELG SEASON AGRICULTURAL SAMPLE SURVEY

According to the 2013/14 (2006 E.C.) Belg Season Crop Production Sample Survey results, total cropland area estimated is about 1 510 345 hectares of land while the estimated number of holders engaged in crop production activity is about 6 897 408 at national level. For more illustration see summary Table 6 bellow.

Table 6. Total Cropland Area and Number of Holders Engaged in 2013/14 (2006 E.C.) Belg Season Crop Production

Total Belg Cropland Area in Hectare	1 510 345
Number of Belg Crop Producing Holders	6 897 408
Improved Farm Management practiced Area (Hectare)	1 100 978
Quantity of Commercial Fertilizer Applied (Quintals)	584 431

As indicated Table 6, during 2013/14 (2006 E.C.), out of the total area under Belg season crops, 1 100 978 hectares (72.90% of the total cropland area) was under the use of improved farm management practices. Moreover, it was estimated that about 584 431 quintals of chemical fertilizer was utilized for crop production nationally. The total cropland areas categorized into different types of farm management practices for the Belg season are summarized and presented in Table 7.

Table 7. Belg Season Cropland Areas under Different Farm Management Practices for the Production Year of 2013/14 (2006 E.C), National Level

Farm Management Practices	Cropland Area		
	Hectare	Percentage from Farm Management Practiced Area	Percentage from Total Cropland Area
Fertilizer	630 441	64.26	41.74
Improved Seeds	76 213	7.77	5.05
Pesticides	154 439	15.74	10.23
Irrigation	119 942	12.23	7.94
Totals	981 035	100	64.95

As shown in Table 7 above, the total crop land area estimated that is applied with fertilizer, improved seed, pesticide and irrigation is about 981 035 hectares. Out of this, the percentage distribution is 64.26% for fertilizer, 7.77% for improved seed, 15.74% for pesticides and 12.23% for irrigation. Out of the cropland area under improved farm inputs, about 630 41 hectares is accounted by fertilizer (Both Natural and Chemical) which is nearly 41.74% of the total Belg cropland area cultivated. Accordingly, improved seed accounted for 76 213 hectares (5.05%) while pesticides and irrigation accounted for 154 439 hectares (10.23%) and 119 942 hectares (7.94%), respectively. Furthermore, the survey findings of the 2013/14 (2006 E.C) Belg season indicates that cereals account for the largest share of the different farm management practices observed as summarized in Table 18.

Table 8. Summary of Cropland Area under Improved Farm Management Practices for Private Peasant Holdings, 2013/14 (2006 E.C.) Belg season, National

Crop Category	Cropland Area			
	Total Area		Area under Improved Farm MGT Practice.	
	Hectare	%	Hectare	% (of total)
Cereals	1 037 966	68.72	666 865	65.52
Pulses	261 101	17.29	129 045	9.68
Oil crops	28 793	1.91	5 561	0.55
Vegetables	28 174	1.87	22 046	2.17
Root Crops	154 310	10.22	194 323	19.08
Total	1 510 345	100	1 017 840	100

As indicated in summary Table 8 above, estimates of total cropland area under different farm management practices shows that cereals accounted for the highest proportion which is 1 037 966 hectares (68.72% of the total all cropland areal), followed by pulses with 261 101 hectares (17.29% from the total all cropped land area). Root crops, vegetables and oil crops accounted for 154 310 hectare (10.22%), 28 174 hectares (1.87%) and 28,793 hectare (1.91%), respectively. Out of the total cereal cultivated cropland area, 666 865 hectare (65.52%) is cultivated with improved farm management practices. The respective numbers are 129 045 hectare (9.68%) for pulses, 5 561 hectare (0.55%) for oil crops, 22 046 hectares (2.17%) for vegetables and 194 323 hectare (19.08%) for root crops.

4.3 FERTLIZER APPLIED AREA AND FERTLIZER TYPE USED

The results of the survey indicate that Belg season cropland area under both natural and chemical fertilizers were estimated to be 630 441 hectares, covering 41.74% of the total area under Belg seasons crops of the private holdings. The percentage of different fertilizers applied is given using summary Table 9 as follows.

Table 9. Summary of Fertilizer Applied Cropland Area for Private Holdings of 2013/14 (2006 E.C.) Belg season, National

Fertilizer Type	Fertilizer Applied Area		%ge from Total Belg Cropland Area
	Hectare	%	
Natural	266 834	42.32	17.67
Commercial			
Dap	258 665	41.03	17.13
Urea	21 862	3.47	1.45
Dap+Urea	83 081	13.18	5.50
Total	630 442	100	41.75

As indicated in Summary Table 9, out of the total fertilizer applied area, 266 834 hectares (42.32% from the total fertilizer applied cropland area) and 17.68% of the total Belg cropland area was reported to be under natural fertilizers. The coverage of chemical fertilizers is estimated to be 363 607 hectares (57.68% from the total fertilizer applied area and 24.08% from the total cropland area), the share of DAP, UREA and the mixture of and DAP and Urea (Dap+Urea), called as commercial fertilizers, constitute 41.03%, 3.47% and 13.18% of the total fertilizer applied cropland area, respectively. The percentages of Dap, Urea and the mixture of Dap and Urea applied out of the total cropland area of the Belg season are: 17.13%, 1.45% and 5.50%, respectively.

4.4 THE USE OF NATURAL FERTLIZER

In general, the application of natural fertilizers for Belg season crops in 2013/14 (2006 E.C.), varies from crop to crop. Of the total area under natural fertilizer, the highest proportion was reported for maize crop, which was estimated at 113 438 hectares (42.51%). The fertilized area (natural fertilizer) under potato stood second with 36 178 hectare (13.56%) while red haricot beans stands third accounting for 27 800 hectare (10.42%) of the total country level natural fertilizer applied of Belg season cropland area.

4.5. THE USE OF COMMERCIAL FERTLIZERS

The total cropland area under commercial fertilizers is about 363 607 hectare (57.68% of total fertilizer applied cropland area), in 2013/14 (2006 E.C.) Belg season. Out of this, DAP is the most used fertilizer which accounted for about 258 665 hectare (71.54% of the commercial fertilizer applied area). The second most applied commercial fertilizer is the mixture Dap and Urea (DAP+UREA) covering 83 081 hectare (accounting for 22.85%) while the use of Urea stands in the third position applied on 21 862 hectare (6.01%) of the total commercial fertilizer applied area. This is more indicated using Figure 5.

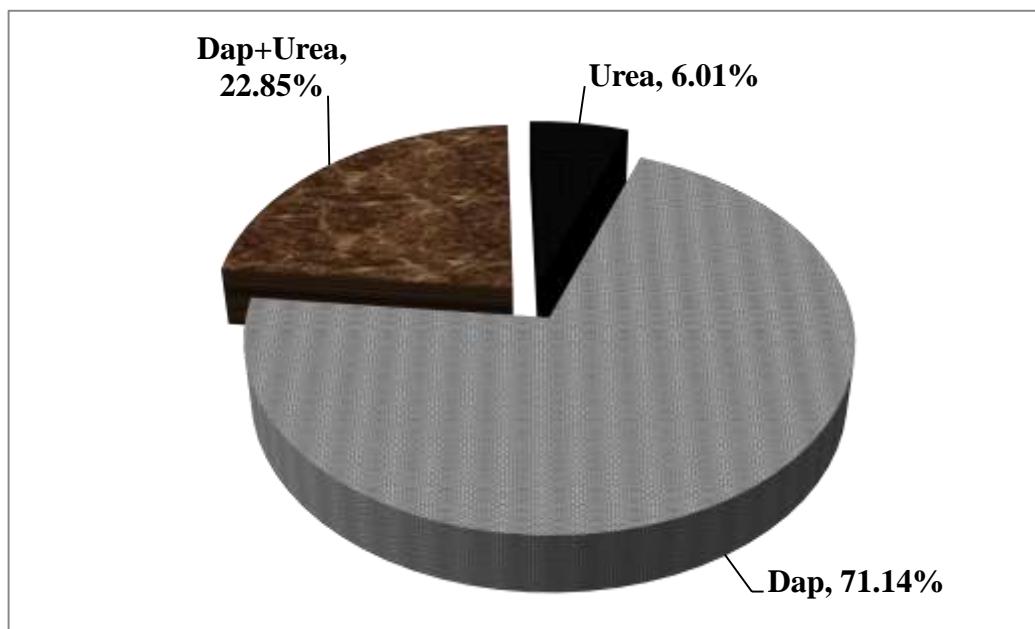

Figure 5 Percentage Distribution of Chemical Fertilizer Applied Cropland Area by Fertilizer Type for Private Holdings of Belg 2013/14 (2006 E.C)

The application of commercial fertilizers also varied between crop types. Of the total area under commercial fertilizers, the highest area was reported for Maize at 121 642 hectares (33%). The second highest area reported under commercial fertilizers was for potatoes accounting for 56 584 hectares (15.56%), followed by barley with 53 972 hectares (14.84%) of the total commercial fertilizer, during the 2013/14 (2006 E.C) Belg season.

Region-wise, the distribution of both natural and commercial fertilizers applied varies from region to region. For instance, of the total area under both (Natural + Commercial) fertilizers, the highest was

reported for Oromia Region, which accounted for 288,440 hectares (45.75%) of the total country level both natural and commercial fertilizers applied cropland area), S.N.N.P and Amhara Regions were in the second and third position in contributing the highest fertilizer (both natural and commercial) applied cropland area which were estimated to be 254 180 hectares (40.32%) and 82 778 hectares (13.13%), respectively. In terms of quantity, the total commercial fertilizer applied is 584431 quintals. Out of this, Dap is the most applied commercial fertilizer accounting for 325 598 quintals (55.72%). The percentage distribution of the chemical fertilizer applied during the production season is more indicated by Figure 6.

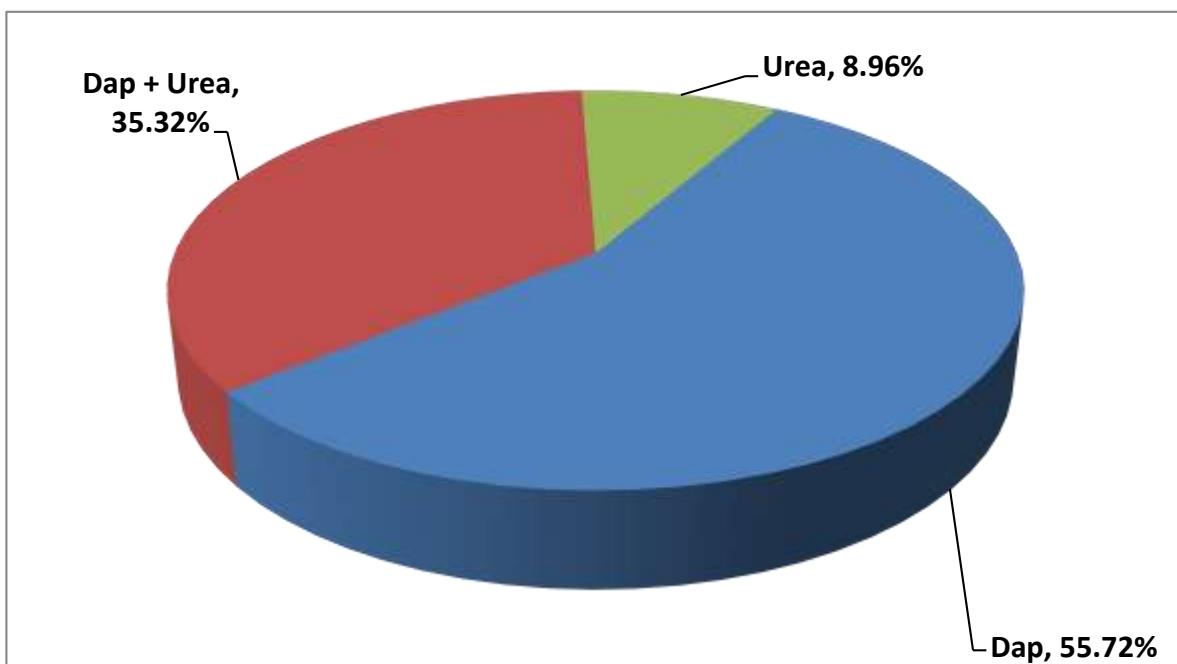

Figure 6. Percentage Distribution of Quantity of Chemical Fertilizers Applied by Fertilizer Type for Private Holding of 2013/14 (2006 E.C) Belg Season, National

As indicated in Figure 6, application of the mixture of Dap and Urea (Dap + Urea) is the second most applied fertilizer type which is about 20 6475 quintals (35.32%) while Urea is the last type of chemical fertilizer applied which is about 52 358 quintals (8.96%).

4.6. NUMBER OF BELG CROP PRODUCING HOLDERS REPORTING THE USE OF IMPROVED FARM MANAGEMENT PRACTICES BY AGE

To easily identify the age category of the holders who used to earn the economic benefits generated from adopting/practicing the use of modern farm management practices on their holdings, Belg crop producing holders' have been categorized into nine groups. These are age groups below 18 years, 18 to 20 years, 21 to 24 years, 25 to 29 years, 30 to 39 years, 40 to 49 years, 50 to 59 years, 60 years and above as well as not stated. The survey result shows that a total of 6 897 408 holders were engaged in the overall Belg season agricultural activities in 2013/14 (2006 E.C.). Accordingly, the category with the largest number of holders is in the age group 30-39, with 1 942 861 holders (which is 28.17% of the total holders). The age group of 40 to 60 stands second with is 1 472 765 holders (21.35% of total holders) . The number and percentage distribution of Belg crop producing holders reporting the use of farm inputs by age group for private holding is given in Table 21.

Moreover, 2 179 384 holders (30.60% of total households) used chemical fertilizer while 545 757 holders (7.91%) used improved seeds. Likewise; 434 058 holders (6.29%) applied pesticides and 576 574 holders (8.36%) used irrigation at national level for 2013/14 (2006 E.C) Belg season, in order to obtain higher crop yield (See Table 21). The number of holders categorized by age and the use of various modern farm inputs are re-presented using Figure 7.

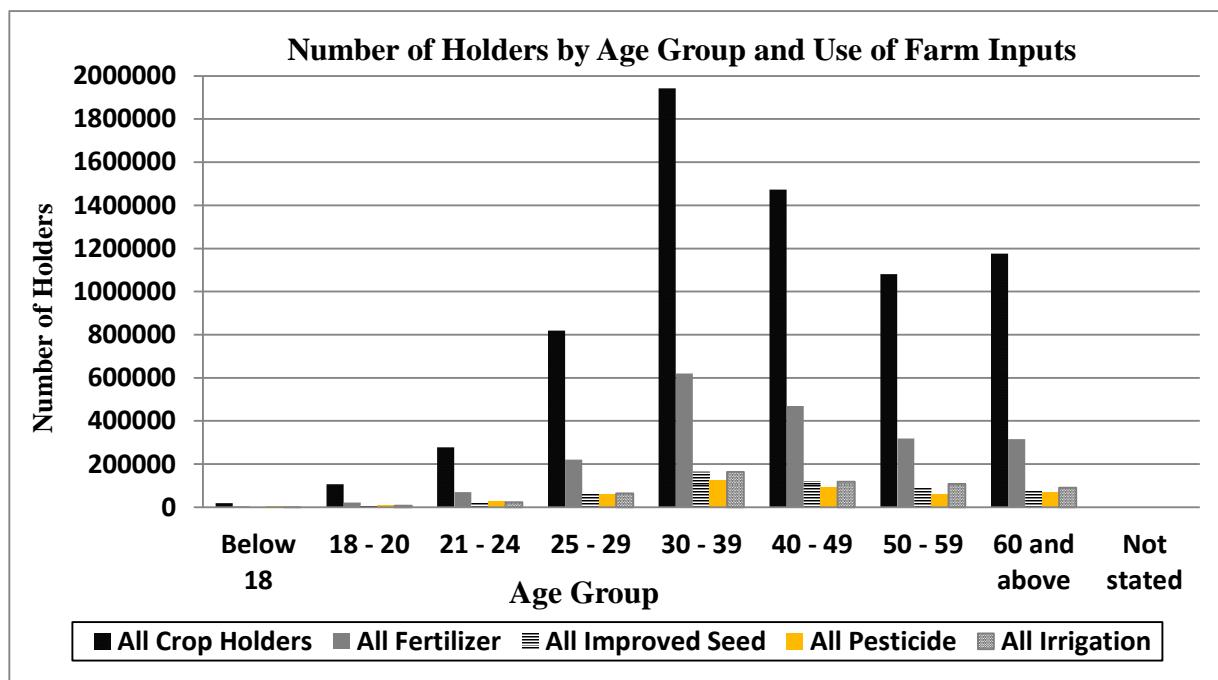

Figure 7. Graphical Representation of Number of Holders Using Inputs by Age for 2013/14(2006 E.C)

4.7 NUMBER OF BELG CROP PRODUCING HOLDERS REPORTING THE USE OF IMPROVED FARM MANAGEMENT PRACTICES BY EDUCATIONAL STATUS

Holders educational status play important role in the adoption of new and improved farming technologies. Therefore, in this report, an attempt is made to categorize holders reporting the use of modern farming practices during the 2013/14 (2006 E.C) Belg season crop production based on their educational status. Based on their education level, holders are categorized in to eight groups consisting of illiterate, literate, grade 1 to 3, grade 4 to 6, grade 7 to 8, grade 9 to 11, grade 12 complete and above grade. The number of Belg crop producing holders using different farm inputs based on education is graphically presented in Figure 8.

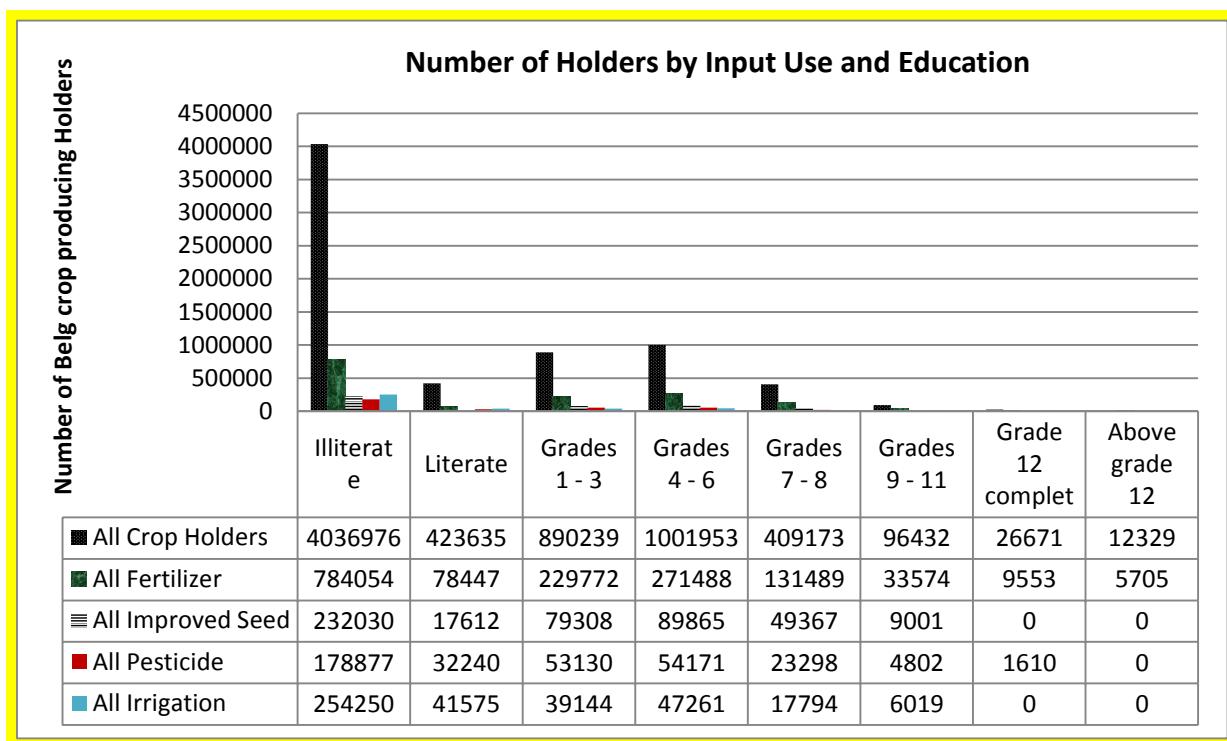

Figure 8. Number of Holders Using Different Inputs by Educational status, 2013/14 (2006 E.C), Belg Season

According to the results of the 2013/14 (2006 E.C) Belg season crop production sample survey, out of the total number of holders (6 897 408), the largest category of the holders number is under the illiterate category in which the number of all crop holders is 4 036 976 (which accounts for 58.53% of total holders) (See Figure 8). Under this category, 784 054 holder are reported for using fertilizer, 232 030 holders using improved seeds, 178 877 using pesticides and 254 250 using irrigation. The second largest category of the number of holders lies on education level of grade four to six. Within this category, the number of holders reported for using all cropland is 1 001 953. The respective number of holders is 271 488 for fertilizer, 89 865 for improved seeds, 54 171 for pesticides and 47 261 for irrigation in the education category.

4.8 NUMBER OF HOLDERS REPORTING DAMAGED CROPLAND AREA BY CAUSES OF DAMAGE

The total number of Belg crop producing private peasant holders who reported crop damage and the cause of damage during the year 2013/14 (2006 E.C) Belg season are estimated to be about 1 731 009 and the damaged cropland area was estimated to be 141 767 hectares. For illustration purpose, the total cropland area affected by crop damage of different crop types in hectare and the various causes of crop damage are presented graphically in Figure 9.

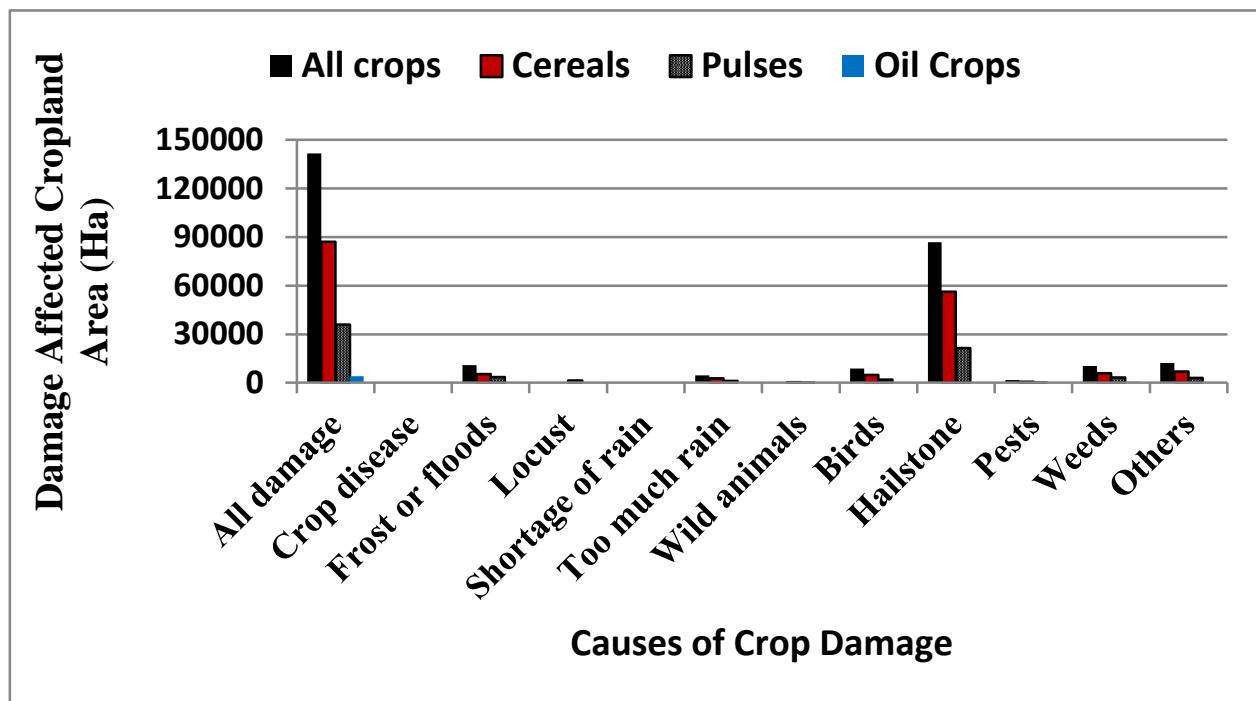

Figure 9 Damaged Cropland Area by Causes of Damage and Crop Category

As indicated in Figure 9, the highest cropland area damaged was reported for cereals which is 87 087 hectares, followed by pulses with about 35 923 hectares and oil crops with 4 207 hectares of damaged cropland area. With regard to the causes of crop damage, it is reported that 86 816 hectares was damaged due to hailstone. The second highest cause of crop damage is frost or floods with estimated crop damaged area of 11 015 hectares while weeds stands third position in damaging 10 403 hectare cropland area (For further details, see Figure 9).

National and Regional Statistical Tables of Farm Management Practices

Table 10: Number of Holders, Inputs Applied Area and Quantity of Inputs used

APPENDIX I

**Estimation Procedures of Totals,
Ratios and Sampling Errors**

APPENDIX I Estimation Procedures of Totals, Ratios and Sampling Errors

The following formulas were used to estimate total area of land under specific crop and production of specific crop in a stratum.

1. For Estimating Total Area of Land under Specific Crop:

$$\hat{A}_h = \sum_{i=1}^{n_h} W_{hi} \sum_{j=1}^{h_{hi}} a_{hij} = \sum_{i=1}^{n_h} W_{hi} a_{hi}$$

in which, $W_{hi} = \frac{M_h H_{hi}}{n_h m_{hi} h_{hi}}$ is the basic weight.

Where:

- h represents the stratum
- n_h is the total number of sample EAs successfully covered in the h^{th} stratum.
- M_h is the measure of size of the h^{th} stratum as obtained from the sampling frame.
- m_{hi} is the measure of size of the i^{th} sample EA in the h^{th} stratum obtained from the sampling frame.
- H_{hi} is the total number of agricultural households of the i^{th} sample EA in the h^{th} stratum.
- h_{hi} is the number of sample agricultural households successfully covered in the i^{th} sample EA in the h^{th} stratum.
- a_{hij} is the value of area for agricultural household j , in the i^{th} EA in the h^{th} stratum under a specific crop.
- a_{hi} is the sample total area under specific crop for EA i in stratum h
- \hat{A}_h estimate of total area under specific crop in stratum h

2. For Estimating Total Number of Holders :

$$Y_h = \sum_{i=1}^{n_h} W_{hi} H_{hi}$$

in which, $H_{hi} = a_{hi} * \bar{Y}_{hi}$

Where,

\bar{Y}_{hi} is average yield per square meter of a specific crop in the i^{th} EA in the h^{th} stratum.

H_h is estimate of total quantity of production of a specific crop in the h^{th} stratum.

H_{hi} is estimate of total quantity of production under specific crop for EA i in stratum h .

3. Sampling Variance of Estimates:

Sampling variance for the estimate of stratum total of area, production and yield for a specific crop are estimated by the following formulas.

$$Var(\hat{A}_h) = (1 - f_h) \frac{n_h}{n_h - 1} \sum_{i=1}^{n_h} \left(\hat{A}_{hi} - \frac{\hat{A}_h}{n_h} \right)^2 + f_h \sum_{i=1}^{n_h} (1 - f_{hi}) \left(\frac{h_{hi}}{h_{hi} - 1} \right) \sum_{j=1}^{h_{hi}} \left(\hat{A}_{hij} - \frac{\hat{A}_{hi}}{h_{hi}} \right)^2$$

$$Var(\hat{P}_h) = (1 - f_h) \frac{n_h}{n_h - 1} \sum_{i=1}^{n_h} \left(\hat{P}_{hi} - \frac{\hat{P}_h}{n_h} \right)^2 + f_h \sum_{i=1}^{n_h} (1 - f_{hi}) \left(\frac{h_{hi}}{h_{hi} - 1} \right) \sum_{j=1}^{h_{hi}} \left(\hat{P}_{hij} - \frac{\hat{P}_{hi}}{h_{hi}} \right)^2$$

Where,

f_h = average first stage probability of selection of EAs within stratum h .

$f_{hi} = \frac{h_{hi}}{H_{hi}}$ = average second stage probability of selection within the i^{th} sample EA in stratum h .

$\hat{A}_{hi}, \hat{P}_{hi}$ are weighted total area and production, respectively, of a specific crop in the i^{th} EA and h^{th} Stratum.

$\hat{A}_{hij}, \hat{P}_{hij}$ are weighted values of area and production, respectively, from j^{th} agricultural household in the i^{th} EA and h^{th} stratum under a specific crop.

Since all strata are independent, the total variance at regional and country level is computed by aggregating the result obtained at Zone/Special Wereda level, i.e.

$$Var(\hat{A}) = \sum_h^L Var(\hat{A}_h), Var(\hat{P}) = \sum_h^L Var(\hat{P}_h)$$

Where, L is the number of strata (Zone/Special Wereda).

In estimating the sampling variance by the above formula, selection of EAs within a stratum is assumed to be with replacement. By so doing the variance estimate may be slightly over estimated but it greatly simplifies the estimation procedure.

4. Coefficient of Variation (CV) of Estimates:

Coefficient of Variation (CV) in percentage of estimate of stratum total of area and production for a specific crop are given by:

$$CV(\hat{A}_h) = \frac{\sqrt{Var(\hat{A}_h)}}{\hat{A}_h} * 100, CV(\hat{P}_h) = \frac{\sqrt{Var(\hat{P}_h)}}{\hat{P}_h} * 100,$$

5. Ninety-five Percent Confidence Interval (CI) of Stratum Total of Area:

$$\hat{A}_h \pm 1.96 * SE(\hat{A}_h) ,$$

Where $SE(\hat{A}_h) = \sqrt{Var(\hat{A}_h)}$ is standard error of the estimate of the stratum total of area.

Estimates of standard error and confidence interval for the other estimates can also be calculated by adopting the above formulas.

APPENDIX II

**Standard Errors and Coefficient of Variation for
Area and Expected Production**
